## Section C

## Objectives and activities

**Summary of the objects of the charity set out in its governing document**

To advance environmental protection or improvement for the benefit of the public by carrying out scientific research into biological nitrogen fixation and publishing the useful results, with a view to securing outcomes in the mitigation of greenhouse gas emissions and water pollution derived from nitrogen fertilisers in agriculture.

**Summary of the main activities undertaken for the public benefit in relation to these objects (include within this section the statutory declaration that trustees have had regard to the guidance issued by the Charity Commission on public benefit)**

The Trustees have at all times had full regard to the Charity Commission guidance on public benefit and have made decisions consistent with the objects and purposes of the Foundation.

The main activity undertaken by the Foundation is scientific research in order to isolate, identify and characterise nitrogen fixing strains of bacteria and to elucidate attributes favourable to their use as a seed inoculants for crops for use by small-holder farmers.

For the period the Trustees have sought grant funding and donations for research projects to expand the development, formulation, production and use of biological nitrogen fixation in small holder agricultural production systems. Of particular note is a project secured for a project in Rwanda but funding and collaboration has also been sought in Mauritius, Senegal and Belize.

In Mauritius the Foundation has a project providing advice to the Mauritian Sugarcane Research Institute (MSRI) in order to re-introduce indigenous strains of the nitrogen-fixing bacteria *Gluconacetobacter diazotrophicus (Gd)* into elite cultivars of sugarcane. No costs have been insured by the Foundation in Mauritius, the field trial costs have been covered by the MSRI.

Research results are being recorded as reports and scientific papers and presented on the Foundation website.

**Additional details of objectives and activities (Optional information)**

You **may choose** to include further statements, where relevant, about:

- policy on grantmaking;
- policy programme related investment;
- contribution made by volunteers.

**Summary of the main achievements of the charity during the year**

The Foundation prepared proposals and applied for grant funding for research projects in the following countries: Mauritius, Senegal, Belize and Rwanda. All the proposals involved collaboration with local partners.

Funding for the project in Rwanda was secured with funding provided through the One Acre Fund. The initial studies undertaken by the Foundation have demonstrated that it is possible to isolate nitrogen fixing bacteria from sugarcane in Rwanda. Many strains were isolated and 44 nitrogen fixing strains of Gd were characterised using a wide range of laboratory and glasshouse bioassays before determining their efficacy in pot trials in Rubengara, Rwanda. Six potential elite strains were identified and their colonisation and impact within different crops including maize, sweet potato, Irish potato, wheat, beans, sorghum and tomato.

The Foundation Lead Scientist Dr Nathalie Narraidoo and Founder Trustee Dr David Dent were co-authors on a paper published with our colleagues from the University of Nottingham:

Michele Pallucchini, Martina Franchini, Enas M. El-Ballat, Nathalie Narraidoo, Benjamin Pointer-Gleadhill, Matthew J. Palframan, Christopher J. Hayes, David Dent, Edward C. Cocking, Michele Perazzolli, Rupert G. Fray and Phil J. Hill (2024)

All the proposals involved collaboration with local partners.</p> <p>Funding was sought for each project and included applications to private donors and public organisations. The Trustees engaged and met with representatives of the Bill and Melinda Gates Foundation and UK Aid. An application was submitted to the Earthshot Prize.</p> <p>A scientific publication was prepared by representatives of the Foundation and the UK National Physical Laboratory, and Manchester and Nottingham Universities on the use of NanoSIMs microscopy to examine <i>in planta</i> nitrogen fixation. The results demonstrate that fixed nitrogen derived from the nitrogen-fixing bacteria <i>Gluconacetobacter diazotrophicus</i> colonised maize, preferentially targeting leaf chloroplasts. This is a significant achievement and a global scientific first.</p>
